

R masterclass

Hadley Wickham

Chief Scientist

RStudio

May 2015

HELLO

my name is

Hadley

Winston Chang
Software Engineer
RStudio

Your turn

Introduce yourself to your neighbours.
Who are you and what are you using R
for?

Day 1

- ~~Introductions~~ & warm ups
- What makes a good function?
- Functional programming
- Object oriented programming (S3)
- Metaprogramming

Advanced R

- This day covers the most important parts of the “Advanced R” book.
- Online for free at <http://adv-r.had.co.nz/>
- Buy physical/kindle version from <http://amzn.com/1466586966>

Warmup

Your turn

What are the four common types of atomic vectors? (Bonus points for the two uncommon types)

Brainstorm with your neighbours for 1 minute.

character

double

integer

logical

raw

complex

```
as.character(c(T, F))
```

```
as.character(seq_len(5))
```

```
as.logical(c(0, 1, 100))
```

```
as.logical(c("T", "F", "a"))
```

```
as.double(c("A", "100"))
```

```
as.double(c(T, F))
```

When vectors of different types occur in an expression, they will be automatically coerced to the same type: character > numeric > logical

typeof()

length()

A scalar is a vector of length 1

Technically, these are all **atomic** vectors

```
typeof(1:10)
```

```
typeof("a")
```

```
typeof(1.5)
```

```
# We'll talk about this later:
```

```
typeof(mtcars)
```

```
typeof(factor(1:10))
```

`mode()`
`storage.mode()`

Designed for S compatibility!

BEWARE!

What does is.numeric() do?

x <- 1

y <- 1L

is.integer(x)

is.integer(y)

is.numeric(x)

is.numeric(x)

What does is.vector() do?

is.vector(x)

comment(x) <- "This is a comment!"

is.vector(x)

Assume a is.*() does something surprising

until proven otherwise (by reading the docs)

```
# Most useful coercion is from logical  
# to numeric  
x <- c(FALSE, TRUE, FALSE, TRUE, TRUE)  
sum(x)  
mean(x)
```

```
x <- sample(1e4, 1e3)  
sum(x > 500)  
mean(x > 500)
```

Your turn

How is a list different from an atomic vector?

How is a data frame different from a matrix?

How do you examine the structure of an object?

Brainstorm with your neighbours for 1 minute.

stro()

Your turn

What are the six types of thing that you can put inside []?

What's the difference between [, [[] and \$? What does drop = FALSE do?

Brainstorm with your neighbour for 1 minutes.

blank	include all
integer	+ve : include 0 : drop all -ve : exclude
logical	keep TRUEs
character	lookup by name

	Simplifying	Preserving
Vectors	<code>x[[1]]</code>	<code>x[1:4]</code>
Matrices/ Data frame	<code>x[1:4,]</code>	<code>x[1:4, , drop = F]</code>
Lists	<code>x[[1]]</code> <code>x\$name</code>	<code>x[1]</code>

If list `x` is a train carrying objects, then `x[[5]]` is the object in car 5; `x[4:6]` is a train of cars 4-6.

Your turn

What's the difference between `x[] <- y`
and `x <- y` ?

```
x <- factor(c("a", "b", "c"))  
x <- c("c", "b", "a")
```

```
x <- factor(c("a", "b", "c"))  
x[] <- c("c", "b", "a")
```
